## 감 사 의 글

이 논문이 완성되기 까지 연구에 바쁘신 가운데도 친절  
하고 자상하게 지도하여 주신 한철순 교수님께 감사를  
드리며, 그동안 많은 도움을 주신 수학교육과의 여러 교  
수님께 심심한 사의를 표합니다.

아울러 그동안 저에게 좋은 지도 조언의 말씀과 격려를  
하여주신 주위의 많은 분들께 또한 감사를 드립니다.

이 논문은  $K$ -공간의 조건 (條件) 을 구하고 두 공간의 Cartesian Product 공간이  $K$ -공간이 되는 조건 (條件) 을 구명 (究明) 할과 아울러  $K$ -공간은 locally compact 공간과 거리공간 (距離空間) 을 포함하는 보다 확장된 공간임을 증명 (證明) 하였다.

## 1. INTRODUCTION

In this paper we will study the class of  $k$ -spaces which is larger than that of locally compact spaces and metric spaces, and prove also the condition that the cartesian product of two  $k$ -spaces is a  $k$ -space.

## 2. MAIN THEOREMS

### **PROPOSITION 2--1**

Let  $X$  be locally compact.

An  $A \subset X$  is open if and only if its intersection with each compact  $C \subset X$  is open in  $C$ .

#### **Proof**

Let  $C$  be compact in a space  $X$  and  $A \subset X$ .

Assume  $A \cap C$  open in  $C$ .

We claim that  $A$  is open in  $X$ .

Let  $a \in A$ . Then  $a \in X$ .

Since  $X$  is locally compact, then there exists a relatively compact nbd  $V(a)$ .

Then  $\overline{V(a)}$  is compact and hence  $A \cap \overline{V(a)}$  is open in  $\overline{V(a)}$ .

So,  $A \cap V(a)$  is open in  $V(a)$ .

Thus,  $A \cap V(a)$  is open in  $X$ .

Therefore  $A$  is open in  $X$ .

For the converse, let  $A$  be open in  $X$ , then  $A \cap C$  is open in each compact  $C \subset X$ .

### **DEFINITION 2-2**

Let  $X$  be a set, and let  $\mathcal{A} = \{A_\alpha \mid \alpha \in \mathbf{A}\}$  be a family of subsets of  $X$ , with each  $A_\alpha$  having a topology.

Assume that for each  $(\alpha, \beta) \in \mathbf{A} \times \mathbf{A}$ , both

(1) The topologies of  $A_\alpha$  and  $A_\beta$  agree on  $A_\alpha \cap A_\beta$ .

(2) Either (a) each  $A_\alpha \cap A_\beta$  is open in  $A_\alpha$  and in  $A_\beta$  or (b) each  $A_\alpha \cap A_\beta$  is closed in  $A_\alpha$  and in  $A_\beta$ .

The weak topology in  $X$  determined (or induced) by  $\mathcal{U}$

$$\mathcal{T}(\mathcal{U}) = \{ U \subset X \mid \forall \alpha : U \cap A_\alpha \text{ is open in } A_\alpha \}$$

### PROPOSITION 2-3

If  $X$  is a space with weak topology determined by  $\{A_\alpha \mid \alpha \in A\}$ , then an  $f: X \rightarrow Y$  is continuous if and only if each  $f|_{A_\alpha}: A_\alpha \rightarrow Y$  is continuous.

#### Proof

If  $f: X \rightarrow Y$  is continuous, then the restriction  $f$  to  $A_\alpha$  is evidently continuous.

Let  $U \subset Y$  be open, then  $f^{-1}(U) \cap A_\alpha = f^{-1}(U \cap A_\alpha) = f_\alpha^{-1}(U)$  is open in  $A_\alpha$  for each  $\alpha \in A$ .

Since  $X$  has a weak topology induced by  $\{A_\alpha \mid \alpha \in A\}$ , then  $f^{-1}(U)$  is open in  $X$ .

Therefore  $f$  is continuous.

### DEFINITION 2-4

Let  $\{Y_\alpha \mid \alpha \in A\}$  be any family of spaces.

For each  $\alpha \in A$ , let  $Y'_\alpha$  be the space  $\{\alpha\} \times Y_\alpha$ , so that  $Y'_\alpha \cong Y_\alpha$  and the family  $\{Y'_\alpha \mid \alpha \in A\}$  is pairwise disjoint.

The free union of the given family  $\{Y_\alpha \mid \alpha \in A\}$  is the set  $\bigcup Y'_\alpha$  with the weak topology determined by the spaces  $Y'_\alpha$ .

This space is denoted by  $\sum_\alpha Y'_\alpha$ .

### PROPOSITION 2-5

Let  $(X, \mathcal{T})$  be a space with weak topology determined by the covering  $\{A_\alpha : \alpha \in \mathcal{A}\}$ .

Let  $A = \sum_{\alpha} A'_\alpha$  be the free union of  $\{A_\alpha : \alpha \in \mathcal{A}\}$ , and for each  $\alpha$ , let  $h_\alpha : A'_\alpha \rightarrow A_\alpha \subset X$  be the homeomorphism  $(\alpha, a) \rightarrow a$ .

Define  $h : \sum_{\alpha} A'_\alpha \rightarrow X$  by  $h|_{A'_\alpha} = h_\alpha$  for each  $\alpha \in \mathcal{A}$ .

Then  $h$  is continuous and  $A/K(h) \cong X$ , where  $K(h)$  is a relation defined by  $x \sim x'$  if  $h(x) = h(x')$ .

Note that  $K(h)$  is an equivalence relation in  $A$ .

#### Proof

It follows from proposition 2-3 that  $h$  is continuous.

Obviously,  $h$  is surjective.

To show the proposition 2-5, we need to show only that  $h$  is an identification.

To do this, let  $U \subset X$  be such that  $h^{-1}(U)$  is open in  $A$ .

Then  $h^{-1}(U) \cap A'_\alpha = h_\alpha^{-1}(U \cap A_\alpha)$  is open in  $A'_\alpha$  for each  $\alpha \in \mathcal{A}$ , and, since  $h_\alpha$  is a homeomorphism,  $U \cap A_\alpha$  is an open in  $A_\alpha$ .

Thus  $U$  is open in  $X$ .

Therefore  $h$  is an identification.

This identification  $h$  turns out to be  $A/K(h) \cong X$ .

It follows from definition 2-2 that a locally compact space has the weak topology determined by the family of its compact subsets.

So we have the following Definition:

### DEFINITION 2-6

A Hausdorff space  $X$  is called a  $k$ -space if and only if it has the weak topology determined by the family of its compact subspaces.

It follows from definition 2-2 and 2-6 that every locally compact space is a  $k$ -space.

### PROPOSITION 2-7

Every 1st countable Hausdorff space is a  $k$ -space.

#### Proof

Let  $X$  be a 1st countable Hausdorff space and  $A \subset X$  such that  $A \cap C$  is closed in  $C$  for each compact  $C$ , then  $A \cap C$  is closed in  $X$ . We claim that  $A$  is closed in  $X$ . Let  $x \in \bar{A}$ , then there is a sequence  $\{a_n \mid n \in \mathbb{Z}^+\} \subset A$  with  $a_n \rightarrow x$ , where  $\mathbb{Z}^+$  is the set of all natural numbers. Thus  $\{a_n \mid n \in \mathbb{Z}^+\} \cup \{x\}$  is compact and so also is the closed  $A \cap (\{a_n \mid n \in \mathbb{Z}^+\} \cup \{x\})$ .

Thus this intersection being infinite subset of  $\{a_n \mid n \in \mathbb{Z}^+\} \cup \{x\}$ , must contain  $x$ , so  $x \in A$ .

Therefore  $A$  is closed.

It follows from definition 2-2 that  $X$  is a  $k$ -space.

### DEFINITION 2-8

Let  $X$  be a space,  $R$  an equivalence relation in  $X$ ,  $X/R$  the quotient set, and  $p$  the canonical projection of  $X$  onto  $X/R$

given by  $p(x) = [x]$ , where  $[x]$  is an equivalence class of  $x$ . Then the set  $X/R$  with the identification topology determined by the projection  $P: X \rightarrow X/R$  is called the quotient space of  $X$  by  $R$ .

### THEOREM 2-9

Let  $X$  be Hausdorff.

Then  $X$  is a  $k$ -space if and only if it is a quotient space of a locally compact space.

#### Proof.

Assume  $X$  to be a  $k$ -space.

It follows from proposition 2-5 that  $X$  is a quotient space of the free union of its compact subspaces, and since the free union of compact subspaces is clearly locally compact, a quotient space of a locally compact space.

For the converse, let  $p: Y \rightarrow X$  be the identification map, where  $Y$  is locally compact, and let  $U \subset X$  such that  $U \cap C$  is open in  $C$  for each compact  $C$ .

We claim  $U$  is open in  $X$ . For each relatively compact open  $V \subset Y$ , we have  $U \cap p(\bar{V})$  open in  $p(\bar{V})$ , that is,  $U \cap p(\bar{V}) = p(\bar{V}) \cap G$  for some open  $G \subset X$ .

Since  $p^{-1}(U) \cap p^{-1}p(\bar{V}) = p^{-1}p(\bar{V}) \cap p^{-1}G$ , we find by intersecting with  $V$ , that  $p^{-1}(U) \cap V = V \cap p^{-1}G$ , therefore  $p^{-1}(U) \cap V$  is open in  $Y$ . Since there is an open covering  $Y = \bigcup_{\alpha} V_{\alpha}$  by relatively compact open sets,  $p^{-1}(U) = \bigcup_{\alpha} p^{-1}(U) \cap V_{\alpha}$  shows  $p^{-1}(U)$  open in  $Y$ , so  $U$  is open in  $X$ . Therefore,  $X$  is a  $k$ -space.

### THEOREM 2-10

If  $X$  is a  $k$ -space and  $p: X \rightarrow Z$  is an identification, then  $Z$  is also a  $k$ -space.

#### Proof

Let  $Y$  be locally compact and  $g: Y \rightarrow X$  an identification. Then  $p \circ g$  is an identification and so by theorem 2-9 and definition 2-8  $Z$  is a  $k$ -space.

### THEOREM 2-11

The cartesian product of two  $k$ -spaces is a  $k$ -space if either (1) both factors are 1st countable or (2) one factor is locally compact.

#### Proof

Consider (1)

We have known that the cartesian product of two 1st countable spaces is 1st countable. It follows from proposition 2-7 that the cartesian product of two 1st countable spaces is a  $k$ -space.

Next we consider (2)

Let  $X$  be a  $k$ -space and  $Y$  a locally compact space.

We claim  $X \times Y$  is a  $k$ -space. We first observe that if  $P$  is any  $k$ -space and  $R$  is any locally compact space, then  $f: P \times R \rightarrow Z$  is continuous if and only if  $f|_C \times R$  is continuous for each compact  $C \subset P$ .

In fact, since  $R$  is locally compact, the continuity of  $f$  is

equivalent to that of  $\hat{f}: P \rightarrow Z^R$ , since  $P$  has the weak topology determined by compact subsets, proposition 2-3 shows that  $\hat{f}$  is continuous if and only if  $\hat{f}|_C$  is continuous for each compact  $C$ , where  $Z^R$  is the set of all continuous maps of  $R$  into  $Z$ . By definition 2-2, every open set in the cartesian product topology  $\mathcal{J}(c)$  of  $X \times Y$  is open in  $k$ -topology  $\mathcal{J}(k)$  of  $X \times Y$ , so we need prove only that  $1: (X \times Y, \mathcal{J}(c)) \rightarrow (X \times Y, \mathcal{J}(k))$  is continuous.

For compact  $C \subseteq X, C' \subseteq Y$ , the compactness of  $C \times C'$  and proposition 2-1 assumes that  $1|_{C \times C'}$  is continuous.

Keeping any compact  $C$  fixed and recalling proposition 2-7 that  $Y$  is a  $k$ -space, our observation above shows that  $1|_{C \times Y}$  is continuous.

Since  $X$  is a  $k$ -space,  $1$  is continuous.

So  $X \times Y$  is a  $k$ -space.

### 3. PRODUCTS OF K-SPACES

In this section, we have that if a product of nonempty space is a  $k$ -space then for each infinite cardinal  $n$ , some product of all but  $n$  of the factors has each  $n$ -fold subproduct  $n$ - $N_0$ -compact.

#### DEFINITION 3-1

A subset  $F$  of a topological space  $X$  is  $k$ -closed if  $F \cap K$  is closed in  $K$  for each compact subset  $K$  of  $X$ . A space in which each  $k$ -closed subset is closed is called a  $k$ -space.

#### DEFINITION 3-2

A space is  $n$ - $N_0$ -compact if each  $n$ -fold open cover contains a finite subcover.

#### DEFINITION 3-3

A space is  $n$ -determined if a subset is closed whenever it meets each subset  $S$  having  $n$  or fewer elements in a set which is closed in  $S$ .

A space is  $n$ -bounded if each subset with  $n$  or fewer elements is contained in a compact set.

#### LEMMA 3-4

If a product of nonempty spaces is a  $k$ -space then, for each infinite cardinal  $n$ , some product of all but  $n$  of its factors has each  $n$ -fold subproduct  $n$ - $N_0$ -compact.

**Proof**

To see Reference (5) p. 160.

**LEMMA 3-5**

For  $n$  an infinite cardinal, an  $m$ -fold Product of  $n$ -determined spaces is  $n$ -determined if and only if all but at most  $n$  of the factors are indiscrete.

**Proof**

To see Reference (5) p. 611.

**DEFINITION 3-6**

A space is called strong  $n$ -bounded if each subset with fewer than  $n$ -elements is contained in a compact set. And a space is called strong  $n$ -determined if a subset is closed whenever it meets each subset  $S$  having fewer than  $n$  elements in a set which is closed in  $S$ .

**PROPOSITION 3-7**

Let  $X = \prod_{\alpha \in n} X_\alpha$ . If each  $X_\alpha$  is strong  $n$ -bounded and strong  $n$ -determined, then  $X$  is a  $k$ -space

**Proof**

Let  $A \subseteq X$  be  $k$ -closed and let  $x$  be any point in the closure of  $A$ . We will produce a subset  $A'$  of  $A$  such that  $x$  is in the

closure of  $A'$  and such that, for each  $\alpha$  and  $n$ ,  $\prod_{\alpha} A'$  has cardinality less than  $n$ . Since each  $X_{\alpha}$  is strong  $n$ -bounded, each  $\prod_{\alpha} A'$ , and hence  $A'$  itself, is contained in a compact set. It follows that  $x$  must be in  $A$  and hence that  $X$  is  $k$ -space, as desired. Let  $\Pi^{\alpha}$  denote the projection from  $X$  to  $X^{\alpha} = \prod_{\beta \in A} X_{\beta}$  and note that, since  $n$  is regular, we have that  $X^{\alpha}$  is strong  $n$ -determined. We first show that, for each  $\alpha$ ,  $\Pi^{\alpha}(x)$  is in  $\Pi^{\alpha}(A)$ . Certainly  $\Pi^{\alpha}(x)$  is in the closure of  $\Pi^{\alpha}(A)$  and hence, since  $X^{\alpha}$  is strong  $n$ -determined,  $\Pi^{\alpha}(x)$  is in the closure of  $\Pi^{\alpha}(B)$  for some subset  $B$  of  $A$  having fewer than  $n$ -elements. Since  $X$  is strong  $n$ -bounded,  $B$  is contained in some compact set  $K$ . Let  $K_1$  be the projection of  $K$  onto  $\prod_{\beta \in A} X_{\beta}$ , and let  $K_2 = \Pi^{\alpha}(K) \cup \{\Pi^{\alpha}(x)\}$ . Since  $A$  is  $k$ -closed,  $A \cap K_1 \times K_2$  is closed in  $K_1 \times K_2$  and therefore its projection onto  $K_2$ , which is just  $\Pi^{\alpha}(A) \cap K_2$ , is closed in  $K_2$ . Since  $\Pi^{\alpha}(B) \subseteq \Pi^{\alpha}(A) \cap K_2$  and  $\Pi^{\alpha}(x)$  is in the intersection of the closure of  $\Pi^{\alpha}(B)$  with  $K_2$ , it follows that  $\Pi^{\alpha}(x)$  is in  $\Pi^{\alpha}(A)$ , as desired. To construct the set  $A'$ , choose, for each  $\alpha$ , a point  $x^{\alpha}$  in  $A$  such that  $\Pi^{\alpha}(x^{\alpha}) = \Pi^{\alpha}(x)$  and let  $A' = \{x^{\alpha} : \alpha \in A\}$ . It is clear that  $A'$  has the desired properties, so the proof is complete.
